Response to Amendment

This office action is in response to amendment filed on 6/30/2006. Of the original claims 1-26, claims 1, 4, 5, 17-23, 26, and 27 have been amended and claim 27 has been added. Upon further review of the claims, the Examiner respectfully submits that a 35 USC 101 rejection is proper as will be explained below.

Claim Rejections - 35 USC § 101

1. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 1-2, and 4-25 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Regarding claim 1, the claims recite a method of estimating the location of a mobile device. Based upon evidence from the specification and independent claims 18-23, the Examiner asserts that this method is a computer instruction or program performed by a processor that comprises functional descriptive material or data structures representing descriptive material. The basis of this assertion is that the method includes "collecting location information", "selecting at least one of a plurality of different location methods", "providing a location estimate", and a final step of "determining a virtual base station estimate", which is an algorithm, but does not define any functionality to be realized. Therefore this claim is considered as non-statutory because of the lack of functionality and applicability.

Regarding claims 18-23, the claims are similar to claim 1, but further define "determining a virtual base station estimate" by presenting mathematical algorithms. In

addition to the reasons stated above in regards to claim 1, the claims define nonstatutory processes because they consist of solely mathematical operations or abstract ideas without some claimed practical application.

Regarding claim 27, the claim recites a system for estimating the location of a mobile device that comprises several "units". The Examiner believes that these units are not physical "units" or computer components, but are "units" in software or program code. Since a computer program is merely a set of instructions capable of being executed by a computer, and the computer program itself is not a process, the claim is treated as a claim for a computer program without the computer-readable medium needed to realize the computer programs functionality, and therefore is considered as nonstatutory functional descriptive material.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 26 does not comply with 112 2nd paragraph because it fails to be constructed to cover the corresponding structure described in the specification and equivalents thereof because it is unclear what those means are referring to in accordance with the specification.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and

Art Unit: 2617

the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

- 4. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 5. Claims 1-17 and 24-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Havinis et al. (US 6,295,454) in view of Sheffer et al. (US 5,844,522).
- A. Regarding claims 1, 26, and 27, Havinis et al. discloses a system and method for providing location information for terminal-based position calculation comprising a Serving Mobile Location Center (SMLC) that can allow a mobile station (MS) to obtain (collect) positioning measurements (location information) (column 4, lines 63-64). The SMLC also chooses an optimum positioning method available that can be network or terminal based (column 4, lines 14-20) via a command message (column 5, lines 16-28). Once the MS obtains the command message, the MS calculates its own location based upon its own positioning measurements, the additional information supplied by the network, and a location function within the MS (column 5, lines 36-40). However, Havinis et al. does not explicitly disclose the determination of a base station estimate. Sheffler et al. a wireless network based location system and method that uses an existing wireless communication network to locate the position of any active phone or transceiver unit in the network (abstract). In the scope of the invention, a

Application/Control Number: 10/526,400

Art Unit: 2617

communication dispatch center (CDC) comprises workstation software that monitors the movement of the mobile station through RSSI readings of agile vector sensors (AVS) installed in each cell site of the network (column 7, lines 36-46). In an example situation, when a phone moves east, but is still connected to an original active cell N (serving cell), the CDC workstation software will determine that the RSSI reading of the active cell is becoming very low, and will also determine that the phone is moving away from the other three AVS units (neighboring cells). As a result of this, the CDC workstation makes a determination that more AVS units closer to the east direction (estimating the direction of the phone) of the AVSs must be added to the original neighbors list (column 20, lines 43-57). The AVS or base station in the estimated direction of the phone that is added to the neighbors list renders the "virtual base station" estimate". Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system of Havinis et al., to include the determination of a virtual base station estimate, as taught by Sheffer et al., in order for the SMLC to hone in on the currently assigned channel to track or locate the mobile station even if intra-cell handoff has occurred.

Page 5

- B. Regarding claim 2, Havinis et al. discloses an example of a message received by the MS containing current cell ID and a Timing Advance (TA) value for a serving base station in order for the MS to calculate its positioning (column 7, lines 24-26).
- C. Regarding claim 4, the limitations are rejected as applied to claims 1 and 2.
- D. Regarding claims 5-7, Sheffer et al. discloses that the predicted neighboring cells are analyzed (column 20, lines 55). This analysis renders the virtual measurement and

Art Unit: 2617

the RSSI readings of the active cell and its neighbors are the real measurement. This location method utilizes cell identity and RSSI values.

- E. Regarding claim 8, Havinis et al. discloses that positioning information within a message shall indicate to the Mobile Switching Center/Visitor Location Register (MSC/VLR) whether the MS can support terminal-based positioning, the type of terminal-based positioning methods supported, and whether the MS is capable of performing location calculations based upon the positioning measurements. Once the MSC/VLR receives this data it is sent to the SMLC so that it can determine the optimum positioning method (column 4, liens 50-59).
- F. Regarding claim 10, Havinis et al. discloses that the MS is commanded to begin the collection of location information (column 5, lines 21-22).
- G. Regarding claim 11, Havinis et al. discloses a Position Measurement Module (PMM) within the MS to perform positioning measurements (column 5, lines 41-44) therefore rendering the arrangement of the mobile device to measure a level of at least one type of information.
- H. Regarding claims 12, 13, and 16, Sheffer et al. discloses that the phone detects the RSSI (received signal level) of the serving cell and neighboring cells (column 20, lines 43-57).
- I. Regarding claim 14, Havinis et al. shows in figure 5 a MS that is represented by a cellular phone (item 20).
- J. Regarding claims 15 and 17, Havinis et al. discloses that a Base Station

 Controller (BSC) provides the current cell ID and Timing Advance (TA) value for a

serving Base Transceiver Station (BTS) and sends this to MSC. The MSC then sends this data to the SMLC, which is then sent to the MS in order to calculate its position (column 7, lines 21-35). The current cell is selected in order to measure information that is sent to the MS for the calculation of its position, therefore rendering the limitations of claim 17.

K. Regarding claims 24-25, Havinis et al. discloses an iterative method in figure 8 by showing the loop-connecting step 870 and 685. A linear method is shown by the flow downward flow of the steps.

Allowable Subject Matter

6. Claims 18-23 would be allowable if rewritten or amended to overcome the rejection(s) under 35 U.S.C. 112, 2nd paragraph, set forth in this Office action.

Response to Arguments

7. Applicant's arguments with respect to claims 1-2 and 4-27 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Nam Huynh whose telephone number is 571-272-5970. The examiner can normally be reached on 8 a.m.-5 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, George Eng can be reached on 571-272-7495. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
